

Welcome to Baldr

Baldr is a lightweight and modern C++ microframework for building scalable and secure HTTP servers. It provides an expressive, composable architecture inspired by contemporary web frameworks, with first-class support for dependency injection, middleware, and modern C++ features out of the box.

Whether you're creating REST APIs, backend services, or embedded control interfaces, Baldr empowers C++ developers to write clean and modular server-side applications.

Key features

- **Compositional HTTP server** with routing, request/response lifecycle, and middleware.
- **Dependency injection container** for clean architecture and testability.
- **Built-in middleware** for logging and rate limiting.
- **Modern C++ APIs** built on smart pointers, generic lambdas, and RAII.
- **Zero-overhead abstractions** with performance in mind.
- **Easily extensible** using your own components and middlewares.

Where to go next

Get started

Install Baldr with CMake and run your first endpoint in minutes.

→ [Get started](#)

Usage

Learn how routing, dependency injection, and middleware fit together.

→ [Usage](#)

Examples

Browse runnable examples for REST APIs, DI, and rate-limited endpoints.
